

IN THE CLAIMS:

Please amend the claims as follows:

1. (Currently Amended) A device, comprising:
 - a memory having a calendar application stored thereon, and
 - a control unit configured for browsing said calendar application, for receiving a high priority event to be added to said calendar application, for searching possible overlapping events in said calendar application as a response to receiving a high priority event, for presenting found one or more overlapping events, for receiving instructions for silencing alarms of ~~the~~ said found one or more overlapping events by one command and for silencing the alarms of ~~the~~ said found one or more overlapping events.
2. (Previously Presented) The device according to claim 1, wherein said control unit is further configured to command a program component to execute said searching for possible overlapping events.
3. (Previously Presented) The device according to claim 1, wherein said control unit is further configured to command a program component to associate processing alternatives with found overlapping events.
4. (Previously Presented) The device according to claim 1, wherein said control unit is configured to command a program component to present to a user the found one or more overlapping events with one or more selectable processing alternatives associated to the found one or more overlapping events.
5. (Previously Presented) The device according to claim 1, wherein said control unit is further configured to command a program component to process the found one or more overlapping events according to received processing instructions.
6. (Previously Presented) The device according to claim 1, wherein a high priority event is selectable from a menu of said calendar application.
7. (Currently Amended) The device according to claim 1, wherein said control unit is for searching ~~said~~ a memory block storing removed overlapping calendar events as a response to

deleting the high priority event from the calendar application, and recovering found, timely matching, previously removed, overlapping events to the calendar application.

8. (Previously Presented) The device according to claim 1, wherein said control unit is for comparing time associated to the high priority event to a respective time of said calendar application for finding possible overlapping events from the calendar application.

9. (Previously Presented) The device according to claim 1, wherein said calendar application is situated in said device using said calendar application.

10. (Previously Presented) The device according to claim 1, wherein said calendar application is situated in a remote device being connected to said device using the calendar application.

11. (Previously Presented) The device according to claim 1, wherein the received high priority event is recognized by the control unit of the device.

12. (Previously Presented) The device according to claim 1, wherein the received high priority event is recognized by the calendar application.

13. (Currently Amended) A method, comprising:

- receiving a high priority event to be added to a calendar application,
- searching possible overlapping events in said calendar application as a response to receiving said high priority event,
- presenting said found one or more overlapping events,
- receiving instructions for silencing alarms of ~~the~~ said found one or more overlapping events by one command and,
- silencing the alarms of ~~the~~ said found one or more overlapping events.

14. (Previously Presented) The method according to claim 13, comprising adding the received high priority event to the calendar application and processing the one or more overlapping events according to the one or more received processing instructions as a response to a confirmation by a user.

15. (Previously Presented) A computer readable medium having a program component

comprising a computer program stored thereon for handling a calendar application, said program for execution by a computer and adapted to perform the method of claim 13 when said program is run on a computer.

16. (Currently Amended) A computer readable medium having a program component with instructions stored thereon for execution by a control unit the method of claim 13 when said ~~program is~~ instructions are run on a computer.

17. (Currently Amended) The device of claim 1, wherein said control unit is further configured to remove ~~removing comprises removing~~ said overlapping event to ~~said a~~ a memory block for possible later recovery in case of cancellation of an added high priority event.

18. (Currently Amended) The method of claim 13, ~~wherein said removing comprises~~ further comprising removing said overlapping event to ~~said a~~ a memory block for possible later recovery in case of cancellation of an added high priority event.

19. (Currently Amended) The computer readable medium of claim 15, ~~wherein said removing comprises~~ further comprising removing said overlapping event to ~~said a~~ a memory block for possible later recovery in case of cancellation of an added high priority event.

20. (Currently Amended) The computer readable medium of claim 16, ~~wherein said removing comprises~~ further comprising removing said overlapping event to ~~said a~~ a memory block for possible later recovery in case of cancellation of an added high priority event.

21. (Currently Amended) A device, comprising:

- means for browsing a calendar application,
- means for receiving a high priority event to be added to said calendar application,
- means for searching possible overlapping events in said calendar application as a response to receiving a high priority event,
- means for presenting found one or more overlapping events,
- means for receiving instructions for silencing alarms of ~~the~~ said found one or more overlapping events by one command and
- means for silencing alarms of ~~the~~ said found one or more overlapping events.
